3.3 Connecting to the GP-IB Interface

GP-IB Cable

The WT1800 is equipped with an IEEE St'd 488-1978 24-pin GP-IB connector. Use GP-IB cables that comply with IEEE St'd 488-1978.

Connection Procedure

Connect the cable as shown below.

Notes about Connections

- · Firmly tighten the screws on the GP-IB cable connector.
- On the PC end, use a GP-IB board (or card) made by National Instruments. For details, see section 3.2.
- The WT1800 may not operate properly if the WT1800 is connected to the PC through converters (such as a GP-IB to USB converter). For more details, contact your nearest YOKOGAWA dealer.
- Several cables can be used to connect multiple devices. However, no more than 15 devices, including the controller, can be connected on a single bus.
- · When connecting multiple devices, you must assign a unique address to each device.
- Use cables that are 2 m or shorter in length to connect devices.
- · Make sure the total length of all cables does not exceed 20 m.
- · When devices are communicating, have at least two-thirds of the devices on the bus turned on.
- To connect multiple devices, wire them in a daisy-chain or star configuration as shown below. You can also mix these configurations. Loop configuration is not allowed.

3-4 IM WT1801-17EN

CAUTION

Be sure to turn off the PC and the WT1800 when connecting or removing communication cables. Otherwise, erroneous operation may result, or the internal circuitry may break.

3-5 IM WT1801-17EN

3.4 Configuring the WT1800 GP-IB Settings

This section explains the following setting for controlling the WT1800 remotely through a GP-IB interface:

· GP-IB address

UTILITY Remote Control Menu

Press **UTILITY**, the **Remote Control** soft key, and then the **GP-IB** soft key to display the following screen.

Note .

- Only use one communication interface: GP-IB, USB, or Network. If you send commands simultaneously from more than one communication interface, the WT1800 will not execute the commands properly.
- When the controller is communicating with the WT1800 or with other devices through GP-IB, do not change the address.
- Each device that is connected by GP-IB has its own unique address in the GP-IB system. This address
 is used to distinguish one device from other devices. Therefore, you must assign a unique address to the
 WT1800 when connecting it to a PC or other device.

3.5 Responses to Interface Messages

Responses to Interface Messages

Responses to Uni-Line Messages

• IFC (Interface Clear)

Clears the talker and listener functions. Stops data transmission if it is in progress.

• REN (Remote Enable)

Switches between the remote and local modes.

IDY (Identify) is not supported.

Responses to Multi-Line Messages (Address commands)

• GTL (Go To Local)

Switches the instrument to local mode.

- SDC (Selected Device Clear)
 - Clears the program message (command) being received and the output queue (see page 6-6 for details).
 - Discards *OPC and *OPC? commands that are being executed.
 - Immediately aborts *WAI and COMMunicate:WAIT commands.
- GET (Group Execute Trigger)

The same operation as the ${}^{\star}\mathbb{T}RG$ command.

PPC (Parallel Poll Configure) and TCT (Take Control) are not supported.

Responses to Multi-Line Messages (Universal commands)

• LLO (Local Lockout)

Prohibits switching to local mode by disabling the LOCAL key on the front panel.

• DCL (Device Clear)

The same operation as the SDC message.

• SPE (Serial Poll Enable)

Sets the talker function on all devices on the bus to serial polling mode. The controller will poll each device in order.

• SPD (Serial Poll Disable)

Clears the serial polling mode of the talker function on all devices on the bus.

PPU (Parallel Poll Unconfigure) is not supported.

What Are Interface Messages?

Interface messages are also referred to as interface commands or bus commands. They are commands that are issued by the controller. They are classified as follows:

Uni-Line Messages

A single control line is used to transmit uni-line messages. The following three messages are available.

- IFC (Interface Clear)
- REN (Remote Enable)
- · IDY (Identify)

IM WT1801-17EN 3-7

Multi-Line Messages

Eight data lines are used to transmit multi-line messages. The messages are classified as follows:

Address Commands

These commands are valid when the instrument is designated as a listener or as a talker. The following five commands are available.

Commands available to a device designated as a listener

- GTL (Go To Local)
- · SDC (Selected Device Clear)
- PPC (Parallel Poll Configure)
- · GET (Group Execute Trigger)

Commands available to a device designated as a talker

TCT (Take Control)

Universal Commands

These commands are valid on all instruments regardless of their listener or talker designation. The following five commands are available.

- LLO (Local Lockout)
- DCL (Device Clear)
- PPU (Parallel Poll Unconfigure)
- SPE (Serial Poll Enable)
- · SPD (Serial Poll Disable)

There are other interface messages: listener-address, talk-address, and secondary commands.

The WT1800 supports interface messages marked with a ★.

Note _

Difference between SDC and DCL

In multi-line messages, SDC messages are address commands that require talker or listener designation and DCL messages are universal commands that do not require a designation. Therefore, SDC messages are directed at a particular instrument while DCL messages are directed at all instruments on the bus.

Programming Overview

Messages

Messages

Messages are used to exchange information between the controller and the WT1800. Messages that are sent from the controller to the WT1800 are called program messages, and messages that are sent from the WT1800 back to the controller are called response messages.

If a program message contains a command that requests a response (query), the WT1800 returns a response message upon receiving the program message. The WT1800 returns a single response message in response to a single program message.

Program Messages

The program message format is shown below.

<Program Message Unit>

A program message consists of one or more program message units. Each unit corresponds to one command. The WT1800 executes the commands in the order that they are received.

Separate each program message unit with a

For details on the program message syntax, see the next section.

Example

<PMT>

<PMT> is a program message terminator. The following three terminators are available.

NL (new line): Same as LF (line feed). ASCII code

"0AH"

^END: The END message as defined by IEEE

(The data byte that is sent with the END message is the last data byte of

the program message.)

NL with an END message attached. NL^END:

(NL is not included in the program

message.)

Program Message Unit Syntax

The program message unit syntax is shown below.

<Program Header>

The program header indicates the command type. For details, see page 4-3.

<Program Data>

Attach program data if there are conditions that are required to execute a command. Separate the program data from the header with a space (ASCII code "20H"). If there are multiple data values, separate each data value with a comma.

For details, see page 4-6.

Example

Response Messages

The response message syntax is as follows:

<Response Message Unit>

A response message consists of one or more response message units; each response message unit corresponds to one response.

Separate each response message unit with a semicolon.

For details on the response message syntax, see the next page.

Example

<RMT>

RMT stands for "response message terminator." The response message terminator is NL^END.

4-1 IM WT1801-17EN

Response Message Unit Syntax

The response message unit syntax is as follows:

<Response Header>

A response header sometimes precedes the response data. Separate the data from the header with a space. For details, see page 4-5.

<Response Data>

Response data contains the content of the response. If there are multiple data values, each data value is separated by a comma. For details, see page 4-5. Example

If there are multiple queries in a program message, responses are returned in the same order that the queries were received in. In most cases, a single query returns a single response message unit, but there are a few queries that return multiple units. The first response message unit always corresponds to the first query, but the nth response unit may not necessarily correspond to the nth query. Therefore, if you want to make sure that every response is retrieved, divide the program messages into individual messages.

Precautions to Be Taken when Sending and Receiving Messages

- If the controller sends a program message that does not contain a query, the controller can send the next program message at any time.
- If the controller sends a program message that
 contains a query, the controller must finish receiving
 the response message before it can send the next
 program message. If the controller sends the next
 program message before receiving the response
 message in its entirety, an error will occur. A
 response message that is not received in its entirety
 will be discarded.
- If the controller tries to receive a response message when there is none, an error will occur. If the controller tries to receive a response message before the transmission of the program message is complete, an error will occur.

If the controller sends a program message
containing multiple message units, but the message
contains incomplete units, the WT1800 will try to
execute the ones that are believed to be complete.
However, these attempts may not always be
successful. In addition, if such a message contains
queries, the WT1800 may not necessary return
responses.

Deadlock

The WT1800 can store at least 1024 bytes of messages in its transmit and receive buffers (the number of available bytes varies depending on the operating conditions). If both the transmit and receive buffers become full at the same time, the WT1800 will no longer be able to operate. This condition is called a deadlock. If this happens, you can resume operation by discarding response messages.

Deadlock will not occur if the program message (including the <PMT>) is kept below 1024 bytes. Program messages that do not contain queries never cause deadlocks.

4.2 Commands

Commands

There are three types of commands (program headers) that a controller may send to the WT1800. The commands differ in their program header formats.

Common Command Header

Commands that are defined in IEEE 488.2-1992 are called common commands. The common command header syntax is shown below. Be sure to include an asterisk (*) at the beginning of a common command.

Common command example: *CLS

Compound Header

Commands, other than common commands, that are specific to the WT1800 are classified and arranged in a hierarchy according to their functions. The compound header syntax is shown below. Be sure to use a colon to specify a lower hierarchical level.

Compound header example: :DISPlay:MODE

Simple Header

These commands are functionally independent and are not contained within a hierarchy. The format of a simple header is shown below.

Simple header example: : HOLD

Note.

A <mnemonic> is an alphanumeric character string.

When Concatenating Commands

Command Groups

A command group is a group of commands that have common compound headers arranged in a hierarchy. A command group may contain subgroups.

Example A portion of the commands from the integration command group

:INTEGrate?
:INTEGrate:MODE
:INTEGrate:TIMer
:INTEGrate:RTIMe?
:INTEGrate:RTIMe:STARt
:INTEGrate:RTIMe:END
:INTEGrate:ACAL
:INTEGrate:STARt
:INTEGrate:STOP
:INTEGrate:RESet

When Concatenating Commands of the Same Group

The WT1800 stores the hierarchical level of the command that is currently being executed and processes the next command on the assumption that it belongs to the same level. Therefore, the common header section can be omitted for commands that belong to the same group.

When Concatenating Commands of Different Groups

If the subsequent command does not belong to the same group, place a colon in front of the header (this colon cannot be omitted).

Example :INTEGrate:MODE NORMal;:
 DISPlay:MODE NUMeric<PMT>

When Concatenating Simple Headers

If a simple header follows another command, place a colon in front of the simple header (this colon cannot be omitted).

When Concatenating Common Commands

Common commands that are defined in IEEE 488.2-1992 are independent of hierarchy. There is no need to use a colon.

When Separating Commands with <PMT>

If you separate two commands with a terminator, two program messages will be sent. Therefore, the common header must be specified for each command even when commands belonging to the same command group are being concatenated.

IM WT1801-17EN 4-3

Upper-Level Query

An upper-level query is a query that is made by appending a question mark to a command higher in the group. The controller can receive all of the settings in a group collectively by executing a highest-level query. Some query groups which are comprised of more than three hierarchical levels can output all the lower level settings.

```
Example:INTEGrate?<PMT> ->
    :INTEGRATE:MODE NORMAL;TIMER
    0,0,0;
    ACAL 0<RMT>
```

The response to an upper-level query can be sent back to the WT1800 as a program message. This enables the settings that were present when the upper-level query was made to be reproduced later on. However, some upper-level queries do not return setup parameters that are not currently in use. Exercise caution because not all of a group's information is necessarily returned in a response.

Header Interpretation Rules

The WT1800 interprets the header that it receives according to the rules below.

· Mnemonics are not case sensitive.

```
Example "CURSor" can be written as "cursor" or "Cursor."
```

· The lower-case characters can be omitted.

```
Example "CURSor" can be written as "CURSO" or "CURS."
```

• The question mark at the end of a header indicates that it is a query. You cannot omit the question mark.

```
Example The shortest abbreviation for "CURSor?" is "CURS?."
```

 If the <x> (value) at the end of a mnemonic is omitted, it is interpreted as a 1.

```
Example If "ELEMent<x>" is written as "ELEM,"
    it means "ELEMent1."
```

 Parts of commands and parameters enclosed in square brackets ([]) can be omitted.

```
Example "[:INPut]SCALing[:STATe][:ALL]
        ON" can be written as "SCAL
        ON."
```

However, the last section enclosed in square brackets cannot be omitted in an upper-level query. Example: "SCALing?" and "SCALing: STATe?" are different queries.

4-4 IM WT1801-17EN

Responses

Responses

When the controller sends a query (a command with a question mark), the WT1800 returns a response message to the guery. The WT1800 returns response messages in one of the following two forms.

· Response Consisting of a Header and Data Responses that can be used as program messages without any changes are returned with command headers attached.

```
Example :DISPlay:MODE?<PMT> -> :
        DISPLAY: MODE WAVE < RMT >
```

· Response Consisting Only of Data

Responses that cannot be used as program messages unless changes are made (query-only commands) are returned without headers. However, there are query-only commands whose responses the WT1800 will attach headers to.

```
Example [:INPut]:POVer?<PMT> -> 0<RMT>
```

If You Want the WT1800 to Return Responses without Headers

You can configure the WT1800 so that even responses that have both headers and data are returned without headers. Use the COMMunicate: HEADer command for this purpose.

Abbreviated Form

The WT1800 normally returns response headers with the lower-case section removed. You can configure the WT1800 so that full headers are returned. Use the COMMunicate: VERBose command for this purpose. The sections enclosed in square brackets ([]) are also omitted in the abbreviated form.

4.4 Data

Data

Data contains conditions and values that are written after the header. A space separates the data from the header. Data is classified as follows:

Data	Meaning
<decimal></decimal>	A value expressed in decimal notation
	(Example: VT ratio setting
	->[:INPut]:SCALing:VT:
	ELEMent1 100)
<voltage><current></current></voltage>	A physical value
<time><frequency></frequency></time>	(Example: Voltage range setting
	->[:INPut]:VOLTage:RANGE:
	ELEMent1 100V)
<register></register>	A register value expressed as binary, octal,
	decimal, or hexadecimal
	(Example: Extended event register value
	->:STATUS:EESE #HFE)
<character data=""></character>	Predefined character string (mnemonic).
	Select from the available strings in braces.
	(Example: Trigger mode selection
	->:DISPlay:WAVE:TRIGger:
	MODE {AUTO NORMal OFF})
<boolean></boolean>	Indicates on and off. Specify ON, OFF, or a
	value.
	(Example: Turning data hold on
	->:HOLD ON)
<string data=""></string>	User-defined string
	(Example: User-defined function
	->:MEASure:FUNCtion1:
	EXPRession "URMS(E1)")
<filename></filename>	Indicates a file name.
	(Example: Save file name
	->:FILE:SAVE:
	SETup[:EXECute] "CASE1")
<block data=""></block>	Data that contains 8-bit values
	(Example: Response to acquired waveform
	data
	-> #40012ABCDEFGHIJKL)

<Decimal>

<Decimal> indicates a value expressed as a decimal number, as shown in the table below. Decimal values are written in the NR form as specified in ANSI X3.42-1975.

Symbol	Meaning	Example		
<nr1></nr1>	Integer	125	-1	+1000
<nr2></nr2>	Fixed-point number	125.0	90	+001.
<nr3></nr3>	Floating-point number	125.0E+0	-9E-1	+.1E4
<nrf></nrf>	Any form from <nr1></nr1>	to <nr3></nr3>		

- The WT1800 can receive decimal values that are sent from the controller in any form, from <NR1> to <NR3>. This is expressed as <NRf>.
- The WT1800 returns a response to the controller in one of the forms from <NR1> to <NR3> depending on the query. The same form is used regardless of the size of the value.
- For the <NR3> form, the plus sign after the "E" can be omitted. You cannot omit the minus sign.

- If a value outside the range is entered, the value is adjusted to the closest value within the range.
- If a value has more significant digits than are available, the value will be rounded.

<Voltage>, <Current>, <Time>, and <Frequency>
<Voltage>, <Current>, <Time>, and <Frequency>
indicate decimal values that have physical significance.
A <Multiplier> or <Unit> can be attached to the <NRf>
form that was described earlier. The following types of expressions are possible.

Form	Example	
<nrf><multiplier><unit></unit></multiplier></nrf>	5MV	
<nrf><unit></unit></nrf>	5E-3V	
<nrf><multiplier></multiplier></nrf>	5M	
<nrf></nrf>	5E-3	

<Multiplier>

<Multipliers> that you can use are indicated in the following table.

Symbol	Word	Multiplier
EX	Exa	10 ¹⁸
PE	Peta	10 ¹⁵
Т	Tera	10 ¹²
G	Giga	10 ⁹
MA	Mega	10 ⁶
K	Kilo	10 ³
M	Milli	10 ⁻³
U	Micro	10 ⁻⁶
N	Nano	10 ⁻⁹
Р	Pico	10 ⁻¹²
F	Femto	10 ⁻¹⁵

<Unit>

Units> that you can use are indicated in the following table.

Symbol	Word	Meaning
V	Volt	Voltage
Α	Ampere	Current
S	Second	Time
HZ	Hertz	Frequency
MHZ	Megahertz	Frequency

- <Multiplier> and <Unit> are not case sensitive.
- "U" is used to indicate micro ("μ").
- "MA" is used for Mega to distinguish it from Milli. However, "MA" is interpreted as milliampere for current. In addition, megahertz is expressed as "MHZ." Therefore, "M (Milli)" cannot be used for frequencies.
- If both <Multiplier> and <Unit> are omitted, the basic unit (V, A, S, or HZ) is used.
- Response messages are always expressed in the <NR3> form. Additionally, they are returned using the basic units, without a multiplier or unit attached.

4-6 IM WT1801-17EN

<Register>

<Register> is an integer that can be expressed in decimal, hexadecimal, octal, or binary notation. It is used when each bit of the value has a particular meaning. The following types of expressions are possible.

Form	Example
<nrf></nrf>	1
#H <hexadecimal made="" of<="" td="" up="" value=""><td>#HOF</td></hexadecimal>	#HOF
the digits 0 to 9 and A to F>	
#Q <octal 0="" 7="" digits="" made="" of="" the="" to="" up="" value=""></octal>	#Q777
#B <binary 0="" 1="" and="" digits="" made="" of="" the="" up="" value=""></binary>	#B001100

- <Register> is not case sensitive.
- Response messages are always expressed in the <NR1> form.

<Character Data>

<Character data> is a predefined character string (a mnemonic). It is mainly used to indicate that an option listed as a character string in braces must be selected and entered. The data interpretation rules are the same as those described in "Header Interpretation Rules" on page 4-4.

Form	Example
{AUTO NORMal}	AUTO

- As with the header, the COMMunicate: VERBose command can be used to select whether to return the response in the full form or in the abbreviated form.
- The COMMunicate: HEADer setting does not affect <character data>.

<Boolean>

<Boolean> is data that indicates ON or OFF. The following types of expressions are possible.

Form	Exa	ample			
{ON OFF <nrf>}</nrf>	ON	OFF	1	0	

- When <Boolean> is expressed in the <NRf> form,
 "OFF" is selected if the rounded integer value is 0, and "ON" is selected for all other cases.
- A response message is always returned with a 1 if the value is ON and with a 0 if the value is OFF.

<String Data>

<String data> is not a predefined character string like <character data>. It can be any character string. The character string must be enclosed in single quotation marks (') or double quotation marks (").

Form	Example		
<string data=""></string>	'ABC' "IEEE488.2-1992"		

- If a character string contains a double quotation mark ("), the double quotation mark is expressed as two consecutive quotation marks (""). This rule also applies to single quotation marks.
- A response message is always enclosed in double quotation marks (").
- <String data> is any character string. Therefore, the instrument assumes that the remaining program message units are part of the character string if no closing single (') or double quotation mark (") is encountered. As a result, no error is detected if a quotation mark is omitted.

<Block Data>

<Block data> is any 8-bit data. It is only used in response messages on the WT1800. The syntax is as follows:

Form	Example
#N <n-digit decimal="" number=""><data byte<="" th=""><th>sequence>#80000010ABCDEFGHIJ</th></data></n-digit>	sequence>#80000010ABCDEFGHIJ

- #N
 - Indicates that the data is <block data>. "N" indicates the number of succeeding data bytes (digits) in ASCII code.
- <N-digit decimal number>
 Indicates the number of bytes of data (example: 00000010 = 10 bytes).
- <Data byte sequence>
 Expresses the actual data (example: ABCDEFGHIJ).
- Data is comprised of 8-bit values (0 to 255). This
 means that the ASCII code "0AH," which stands for
 "NL," can also be included in the data. Hence, care
 must be taken when programming the controller.

IM WT1801-17EN 4-7

4.5 Synchronization with the Controller

Overlap Commands and Sequential Commands

There are two types of commands: overlap and sequential. The execution of one overlap command can start before the execution of the previous overlap command is completed.

If you specify the voltage range and send the next program message while you are querying the result, the WT1800 always returns the most recent setting (100 V in this case).

```
:INPut:VOLTage:RANGe;ELEMent1 100V;
ELEMent?<PMT>
```

This is because the next command is forced to wait until the processing of :INPut:VOLTage:
RANGe; ELEMent1 is completed. This type of command is called a sequential command.
Let us assume you send the next program message when you want to load a file and query the voltage range of the result.

```
:FILE:LOAD:SETup "FILE1";:INPut:VOLTage: RANGe:ELEMent1?
```

In this case, :INPut:VOLTage:RANGe:ELEMent1? is executed before the loading of the file is completed, and the voltage range that is returned is the value before the file is loaded.

Overlapping refers to the act of executing the next command before the processing of the current command is completed, such as in the command FILE: LOAD: SETup. A command that operates in this way is called an overlap command.

You can prevent overlapping by using the following methods.

Synchronizing to Overlap Commands

Using the *WAI command

The *WAI command holds the subsequent commands until the overlap command is completed.

```
Example :COMMunicate:OPSE #H0040;:
    FILE:LOAD:SETup "FILE1";*WAI;:
    INPut:VOLTage:RANGe:
    ELEMent1?<PMT>
```

The COMMunicate: OPSE command is used to select which command to apply ${}^*\mathbb{WAI}$ to. Here, it is applied to the media access command.

```
*WAI is executed before :INPut:VOLTage:
RANGe:ELEMent1?, so :INPut:VOLTage:
RANGe:ELEMent1? is not executed until the file
loading is completed.
```

Using the COMMunicate: OVERlap command

The COMMunicate: OVERlap command enables (or disables) overlapping.

```
Example :COMMunicate:OVERlap #HFFBF;:
    FILE:LOAD:SETup "FILE1";:
    INPut:VOLTage:RANGe:
    ELEMent1?<PMT>
```

COMMunicate:OVERlap #HFFBF enables overlapping for commands other than media access. Because overlapping of file loading is disabled, FILE:LOAD:SETup operates in the same way as a sequential command. Thus, :INPut:VOLTage: RANGe:ELEMent1? is not executed until file loading is completed.

Using the *OPC command

The *OPC command sets the OPC bit, which is bit 0 in the standard event register (see page 6-4 for details), to 1 when the overlapping is completed.

```
Example :COMMunicate:OPSE #H0040;
    *ESE 1;*ESR?;*SRE 32;:FILE:
    LOAD:SETup "FILE1";*OPC<PMT>
    (Read the response to*ESR?)
    (Wait for a service request)
    :INPut:VOLTage:RANGe:
    ELEMent1?<PMT>
```

The COMMunicate: OPSE command is used to select which command to apply *OPC to. Here, it is applied to the media access command.

*ESE 1 and *SRE 32 indicate that a service request is only generated when the OPC bit becomes 1.

*ESR? clears the standard event register.
In the example above, :INPut:VOLTage:RANGe:
ELEMent1? is not executed until a service request is generated.

· Using the *OPC? query

The *OPC? query generates a response when an overlapping operation is completed.

```
Example :COMMunicate:OPSE #H0040;
    :FILE:LOAD:SETup "FILE1";
    *OPC?<PMT>
    (Read the response to *OPC?)
    :INPut:VOLTage:RANGe:
    ELEMent?<PMT>
```

4-8 IM WT1801-17EN

The COMMunicate: OPSE command is used to select which command to apply *OPC? to. Here, it is applied to the media access command.

Because *OPC? does not generate a response until the overlapping operation is completed, the file loading will have been completed by the time the response to *OPC? is read.

Note.

Most commands are sequential commands. Overlap commands are indicated as such in chapter 5. All other commands are sequential commands.

Achieving Synchronization without Using Overlap Commands

Even when using sequential commands, there are times when it is necessary to achieve synchronization to properly query the measured data. For example, if you want to query the most recent numeric data each time that the measured data is updated, you can attempt to do this by sending the :NUMeric[:NORMal]:VALue? command with some arbitrary timing. However, because the WT1800 returns the current measured data regardless of whether the measured data has been updated since the previous query, this method may return data that is the same as the previous data. If this happens, you must use the following method to synchronize with the end of measured data updating.

· Using the STATus:CONDition? query

STATus: CONDition? is used to query the contents of the condition register (see page 6-5 for details). You can determine whether the measured data is being updated by reading bit 0 of the condition register. If bit 0 of the condition register is 1, the measured data is being updated. If it is 0, the measured data can be queried.

• Using the extended event register

The changes in the condition register can be reflected in the extended event register (see page 6-5 for details).

The STATus:FILTer1 FALL command sets the transition filter so that bit 0 in the extended event (FILTer1) is set to 1 when bit 0 in the condition register changes from 1 to 0.

The STATus: EESE 1 command is used to only change the status byte based on bit 0 in the extended event register.

The STATus: EESR? command is used to clear the extended event register.

The *SRE 8 command is used to generate service requests based only on the changes in the extended event register bits.

The : NUMeric[:NORMal]: VALue? command is not executed until a service request is generated.

• Using the COMMunicate:WAIT command

The COMMunicate: WAIT command is used to wait for a specific event to occur.

For a description of STATus:FILTer1 FALL and STATus:EESR?, see the previous section about the extended event register.

The COMMunicate: WAIT 1 command specifies that the program will wait for bit 0 in the extended event register to be set to 1.

:NUMeric[:NORMal]:VALue? is not executed until bit 0 in the extended event register becomes 1.

:COMMUNICATE:OPSE? -> :COMMUNICATE:OPSE 96

Description In the above example, all bits are set to 1 to make

all overlap commands applicable. However, bits fixed to 0 are not set to 1, so the response to the

query only indicates 1 for bits 5 and 6.

:COMMunicate:OPSR?

Function Queries the operation pending status register.

Syntax :COMMunicate:OPSR?
Example :COMMunicate:OPSR? -> 0

Description Operation pending status register and overlap

enable register

incomplete.

When bit 6 (ACS) = 1: Storage media access is

incomplete.

:COMMunicate:OVERlap

:COMMUNICATE:OVERLAP? ->
:COMMUNICATE:OVERLAP 96

Description • In the above example, all bits are set to 1 to make all overlap commands applicable.

However, bits fixed to 0 are not set to 1, so the

response to the query only indicates 1 for bits

5 and 6.

 For information about how to synchronize a program using COMMunicate:OVERlap, see

page 4-8.

 In the above example, bits 5 and 6 are set to 1 to make all overlap commands applicable (see the figure for the :COMMunicate:OPSR?

command).

ASCII: NAN (Not A Number)

FLOAT: 0x7E951BEE (9.91E+37)

- Over-range (the display shows "---O L---")
- Overflow (the display shows "---O F---")
- Data over (the display shows " Error ")

ASCII: INF (INFinity)

FLOAT: 0x7E94F56A (9.9E+37)

Note.

- In 180° (Lead/Lag) display, the phase differences Φ (PHI) of elements 1 to 6 are output in the range between -180.00 to 180.00 with lead (D) and lag (G) set to negative and positive values, respectively.
- There may be up to six digits in the mantissa of the Σ of power values P, S, and Q depending on the
 combination of the voltage range and current range (e.g. the power range). For the table of power ranges,
 see the getting started guide, IM WT1801-03EN.
- The following values always have three decimal places: efficiency values ETA1, ETA2, ETA3, and ETA4; harmonic distortion factor values UHDFk, IHDFk, and PHDFk; and distortion factor values UTHD, ITHD, and PTHD.If the values exceed 100 %, the mantissa will have six digits.

* Preset Patterns for Numeric Data Items

The Function Option List in the DISPlay Group section contains a list of the function names used in commands (where the command syntax contains <Function>) and the function names in the WT1800 display menus that correspond to them.

Note.

This list indicates the measurement function and element that are assigned to each item number (ITEM<x>). Items that are not set to be measured are displayed or output in the same fashion as when the data does not exist. For example, if frequency FI of the current of element 2 is not set to be measured, the output of ITEM19 in pattern 1 is the same as the output when the data does not exist (NAN if the data format is ASCII).

5.22 WAVeform Group

The commands in this group deal with the acquired waveform data.

There are no front panel keys that correspond to the commands in this group.

:WAVeform?

Function Queries all waveform display data output settings.

Syntax : WAVeform?

:WAVeform:BYTeorder

Function Sets or queries the output byte order of the

waveform display data (FLOAT format) that is transmitted by the :WAVeform:SEND? command.

Syntax : WAVeform: BYTeorder {LSBFirst|

MSBFirst}

:WAVeform:BYTeorder?

Example : WAVEFORM: BYTEORDER MSBFIRST

:WAVEFORM:BYTEORDER? ->

display data that is transmitted by the :WAVeform:

SEND? command.

Syntax : WAVeform:FORMat {ASCii|FLOat}

:WAVeform:FORMat?

waveforms.

Syntax : WAVeform: HOLD {<Boolean>}

:WAVeform:HOLD?

Example : WAVEFORM: HOLD ON

:WAVEFORM:HOLD? ->

:WAVEFORM:HOLD 1

Description • If :WAVeform:HOLD is set to ON before :

WAVeform:SEND? is executed, all the waveform data at that point can be held

internally.

 As long as :WAVeform:HOLD is set to ON, waveform data is held even when the

waveform display on the screen is updated.

 For example, if you want to acquire U1 and I1 waveform display data at the same point in time, use the following commands:

:WAVeform:HOLD ON

:WAVeform:TRACe U1

:WAVeform:SEND?

(Receive the waveform display data of U1.)

:WAVeform:TRACe I1

:WAVeform:SEND?

(Receive the waveform display data of I1.)

:WAVeform:HOLD OFF

 If: WAVeform: HOLD is set to ON after having already been set to ON before, the waveform display data is cleared, and the most recent waveform data is held internally. When retrieving waveform display data continuously, this method can be used to circumvent the need to repeatedly set: WAVeform: HOLD to

OFF.

:WAVeform:LENGth?

Function Queries the total number of points of the

waveform specified by the :WAVeform:TRACe $\begin{tabular}{ll} \end{tabular} \label{table:eq:table:prop}$

:WAVEFORM:SEND? -> <NR3>, <NR3>, ...

• When :WAVeform:FORMat is set to FLOat:

:WAVEFORM:SEND? -> #4? (4-digit number of bytes) (data byte

sequence)

Description The format of the waveform display data that is

output varies depending on how the :WAVeform: FORMat command is set. The different formats are explained below.

(1) When the format is set to ASCii:

Physical values are output in <NR3> format.The

point follows the order that is set by using the :

points are separated by commas. (2) When the format is set to FLOat: Physical values are output in IEEE singleprecision floating point (4-byte) format. The output byte order of the data of each

WAVeform:BYTeorder command.

WAVeform: SEND? command.

:WAVeform:TRACe {U<x>|I<x>|SPEed| Syntax

TORQue | AUX<x>} :WAVeform:TRACe?

U < x > and I < x > 's < x > = 1 to 6 (element)AUX < x > 's < x > = 1 or 2 (AUX input

channel)

:WAVEFORM:TRACE U1 Example

> :WAVEFORM:TRACE? -> :WAVEFORM:TRACE U1

Description • SPEed and TORQue can only be selected on models with the motor evaluation function (/MTR) option.

> AUX<x> can only be selected on models with the auxiliary input (/AUX) option.

:WAVeform:TRIGger?

Queries the trigger position of the acquired Function

waveform.

Syntax :WAVeform:TRIGger? Example :WAVEFORM:TRIGGER? -> 0

Description Because the trigger position is always at the

beginning of the waveform display data, 0 is

returned.

5-101 IM WT1801-17EN

5.23 Common Command Group

The commands in this group are defined in IEEE 488.2-1992 and are independent from the instrument's individual functions. There are no front panel keys that correspond to the commands in this group.

*CAL?

Function Executes zero calibration (zero-level

compensation, the same operation as pressing CAL—SHIFT+SINGLE) and queries the result.

Syntax *CAL?

Example *CAL? -> 0

Description $\mbox{ If the calibration ends normally, 0 is returned. If }$

an error is detected, 1 is returned.

*CLS

Function Clears the standard event register, extended

event register, and error queue.

Syntax *CLS Example *CLS

Description • If the *CLS command is located immediately

after the program message terminator, the output queue is also cleared.

• For information about each register and queue, see chapter 6.

*ESE

Function Sets or queries the standard event enable

register.

Syntax *ESE {<NRf>}

*ESE?

< NRf > = 0 to 255

Example *ESE 251

*ESE? -> 251

Description • Specify the value as a sum of the values of each bit in decimal format.

- For example, specifying *ESE 251 will cause
 the standard enable register to be set to
 11111011.In this case, bit 2 of the standard
 event register is disabled. This means that bit 5
 (ESB) of the status byte register is not set to 1,
 even if a query error occurs.
- The default value is *ESE 0 (all bits disabled).
- A query using *ESE? will not clear the contents of the standard event enable register.
- For information about the standard event enable register, see page 6-4.

*ESR?

Function Queries and clears the standard event register.

Syntax *ESR?

Example *ESR? -> 32

Description • A sum of the values of each bit is returned in decimal format.

- When an SRQ is sent, you can check what types of events have occurred.
- For example, if a value of 32 is returned, this indicates that the standard event register is set to 00100000. This means that the SRQ occurred due to a command syntax error.
- A query using *ESR? will clear the contents of the standard event register.
- For information about the standard event register, see page 6-4.

*IDN?

Function Queries the instrument model.

Syntax *IDN?
Example *IDN? ->

YOKOGAWA, WT1806-06, 123456789, F1.01

 $\label{eq:description} \mbox{\bf - The information is returned in this form:}$

<Manufacturer>, <Model>, <Serial no.>, <Firmware version>.

<Model> is returned in the following format:
 "six-digit model code—two-digit element
 structure."For details on the model code and
 element structure, see "Checking the Package
 Contents" in the getting started guide, IM

WT1801-03EN.

*OPC

Function Sets bit 0 (the OPC bit) of the standard event

register to 1 upon the completion of the specified

overlap command.

Syntax *OPC Example *OPC

Description • For information about how to synchronize a program using *OPC, see page 4-8.

 The COMMunicate:OPSE command is used to specify the overlap command.

 If *OPC is not the last command of the message, its operation is not guaranteed.

5-102 IM WT1801-17EN

*OPC?

Returns ASCII code 1 if the specified overlap Function

command has finished.

*OPC? Syntax *OPC? -> 1 Example

Description • For information about how to synchronize a program using *OPC, see page 4-8.

- The COMMunicate:OPSE command is used to specify the overlap command.
- · If *OPC? is not the last command of the message, its operation is not guaranteed.

*OPT?

Function Queries the installed options.

Syntax *0PT?

*OPT? -> EX6, B5, G5, DT, FQ, V1, DA, MTR Example

- Description Returns the presence of the following options: the external current sensor input option (EX1 for the WT1801, EX2 for the WT1802, EX3 for the WT1803, EX4 for the WT1804, EX5 for the WT1805, and EX6 for the WT1806), the builtin printer (B5), the harmonic measurement option (G5), the simultaneous dual harmonic measurement option (G6), the delta computation option (DT), the add-on frequency measurement option (FQ), the RGB output option (V1), the 20-channel D/A output option (DA), the motor evaluation function (MTR), the auxiliary input option (AUX), and high speed data capturing option (HS).
 - If none of the options are installed, ASCII code 0 is returned
 - The *OPT? query must be the last query of a program message.

An error occurs if there is a query after the *OPT query.

*RST

Function Initializes the settings.

Syntax *RST Example *RST

- Description Also clears *OPC and *OPC? commands that have been sent
 - · All settings except communication settings are reset to their factory default values.

*SRE

Function Sets or gueries the service request enable

register.

*SRE {<NRf>} Syntax

*SRE?

< NRf > = 0 to 255

*SRE 239 Example

*SRE? \rightarrow 175 (because the bit 6,

MSS, setting is ignored)

Description • Specify the value as a sum of the values of each bit in decimal format.

- · For example, specifying *SRE 239 will cause the standard enable register to be set to 11101111. In this case, bit 4 of the service request enable register is disabled. This means that bit 4 (MAV) of the status byte register is not set to 1, even if the output queue is not empty.
- Bit 6 (MSS) of the status byte register is the MSS bit itself and is therefore ignored.
- · The default value is *SRE 0 (all bits disabled).
- A guery using *SRE? will not clear the contents of the service request enable register.
- · For information about the service request enable register, see page 6-3.

*STB?

Function Queries the status byte register.

*STB? Syntax *STB? -> 4 Example

Description • A sum of the values of each bit is returned as a decimal value

- · Because the register is read without executing serial polling, bit 6 is an MSS bit, not an RQS
- · For example, if a value of 4 is returned, this indicates that the status byte register is set to 00000100. This means that the error queue is not empty (in other words, an error occurred).
- A query using *STB? will not clear the contents of the status byte register.
- · For information about the status byte register, see page 6-3.

*TRG

Function Executes single measurement (the same

operation as when SINGLE is pressed).

Syntax *TRG *TRG Example

Description A multi-line message GET (Group Execute

Trigger) will perform the same operation as this

command.

5.23 Common Command Group

*TST?

Function Performs a self-test and queries the result.

Syntax *TST?
Example *TST? -> 0

Description • The self-test consists of tests of each kind of internal memory.

 This command returns 0 if the self-test is successful and 1 if it is not. If the condition of the WT1800 prevents the self-test from being executed (this happens for example if the WT1800 is performing integration or storage), the WT1800 will return an appropriate error code.

 It takes approximately 30 seconds for the test to complete. When receiving a response from the WT1800, set the timeout to a relatively large value.

*WAI

Function Holds the execution of the subsequent command

until the completion of the specified overlap command.

Syntax *WAI
Example *WAI

Description • For information about how to synchronize a program using *WAI, see page 4-8.

• The COMMunicate:OPSE command is used to specify the overlap command.

Registers and Queues That Affect the Status Byte

The following registers affect the status byte bits.

Register	Affected Status Byte Bit	
Standard event register	Sets bit 5 (ESB) to 1 or 0	
Output queue	Sets bit 4 (MAV) to 1 or 0	
Extended event register	Sets bit 3 (EES) to 1 or 0	
Error queue	Sets bit 2 (EAV) to 1 or 0	

Enable Registers

The following registers are used to mask a bit so that the bit will not affect the status byte even when the bit is set to 1.

Masked Register	Mask Register
Status byte	Service request enable register
Standard event register	Standard event enable register
Extended event register	Extended event enable register

Reading and Writing to Registers

For example, you can use the $*{\tt ESE}$ command to set the standard event enable register bits to ones and zeros. You can use the $*{\tt ESE}$? command to query whether the standard event enable register bits are ones or zeros. For details on these commands, see chapter 5.

6-2 IM WT1801-17EN

6.2 Status Byte

Status Byte

• Bits 0, 1, and 7

Not used (always 0)

• Bit 2 EAV (Error Available)

This bit is set to 1 when the error queue is not empty. In other words, this bit is set to 1 when an error occurs. For details, see page 6-6.

• Bit 3 EES (Extend Event Summary Bit)

This bit is set to 1 when the logical AND of the extended event register and the extended event enable register is 1. In other words, this bit is set to 1 when a certain event takes place inside the instrument. For details, see page 6-5.

• Bit 4 MAV (Message Available)

This bit is set to 1 when the output queue is not empty. In other words, this bit is set to 1 when there is data to be transmitted in response to a query. For details, see page 6-6.

• Bit 5 ESB (Event Summary Bit)

This bit is set to 1 when the logical AND of the standard event register and the standard event enable register is 1. In other words, this bit is set to 1 when a certain event takes place inside the instrument. For details, see page 6-4.

Bit 6 RQS (Request Service)/ MSS (Master Status Summary)

This bit is set to 1 when the logical AND of the status byte (excluding bit 6) and the service request enable register is 1. In other words, this bit is set to 1 when the instrument requests service from the controller. RQS is set to 1 when the MSS bit changes from 0 to 1 and is cleared when serial polling is carried out or when the MSS bit changes to 0.

Bit Masking

To mask a bit in the status byte so that it does not cause an SRQ, set the corresponding bit of the service request enable register to 0.

For example, to mask bit 2 (EAV) so that service is not requested when an error occurs, set bit 2 of the service request enable register to 0. Do this using the *SRE command. To query whether each bit of the service request enable register is 1 or 0, use *SRE?. For details on the *SRE command, see chapter 5.

Status Byte Operation

A service request is issued when bit 6 in the status byte becomes 1. Bit 6 is set to 1 when any other bit becomes 1 (when the corresponding bit of the service request enable register is also set to 1). For example, if an event occurs and the logical AND of a standard event register bit and its corresponding enable register bit is 1, then bit 5 (ESB) is set to 1. At this point, if bit 5 of the service request enable register is 1, bit 6 (MSS) is set to 1, and the WT1800 requests service from the controller.

You can check what type of event occurred by reading the contents of the status byte.

Reading the Status Byte

There are two ways to read the contents of the status byte.

*STB? query

Bit 6 functions as MSS when a query is made using *STB?. This causes the MSS to be read. This query does not cause any of the status byte bits to be cleared after the status byte is read.

· Serial polling

Bit 6 functions as RQS when serial polling is issued. This causes the RQS to be read. After the status byte is read, only the RQS bit is cleared. You cannot read the MSS bit when serial polling is used.

Clearing the Status Byte

There is no way to clear all the bits in the status byte. The bits that are cleared for each operation are shown below.

*STB? query

None of the bits are cleared.

Serial polling

Only the RQS bit is cleared.

· When a *CLS command is received

When a *CLS command is received, the status byte itself is not cleared, but the contents of the standard event register, which affect the bits in the status byte, are cleared. As a result, the corresponding status byte bits are cleared. Because the output queue is not cleared with a *CLS command, bit 4 (MAV) in the status byte is not affected. However, the output queue will be cleared if the *CLS command is received just after a program message terminator.

6.3 Standard Event Register

Standard Event Register

7	6	5	4	3	2	1	0
PON	URQ	CME	EXE	DDE	QYE	RQC	OPC

• Bit 7 PON (Power ON)

This bit is set to 1 when the instrument is turned on.

• Bit 6 URQ (User Request)

Not used (always 0)

• Bit 5 CME (Command Error)

This bit is set to 1 when there is a command syntax error.

Examples Command names are misspelled, or character data that is not one of the available options has been received.

• Bit 4 EXE (Execution Error)

This bit is set to 1 when the command syntax is correct, but the command cannot be executed in the current state.

Examples Parameters are out of range, or a command has been received for an option that is not installed.

• Bit 3 DDE (Device Error)

This bit is set to 1 when a command cannot be executed for internal reasons other than a command syntax error or command execution error.

• Bit 2 QYE (Query Error)

This bit is set to 1 when a query command is received, but the output queue is empty or the data is lost

Examples There is no response data, or data is lost due to an overflow in the output queue.

• Bit 1 RQC (Request Control)

Not used (always 0)

• Bit 0 OPC (Operation Complete)

This bit is set to 1 upon the completion of the operation designated by the *OPC command (see chapter 5 for details).

Bit Masking

To mask a certain bit of the standard event register so that it does not cause bit 5 (ESB) in the status byte to change, set the corresponding bit of the standard event enable register to 0.

For example, to mask bit 2 (QYE) so that ESB will not be set to 1 even if a query error occurs, set bit 2 of the standard event enable register to 0. Do this using the $*{\tt ESE}$ command. To query whether each bit of the standard event enable register is 1 or 0, use $*{\tt ESE}$?. For details on the $*{\tt ESE}$ command, see chapter 5.

Standard Event Register Operation

The standard event register indicates eight types of events that occur inside the instrument. When one of the bits in this register becomes 1 (and the corresponding bit of the standard event enable register is also 1), bit 5 (ESB) in the status byte is set to 1. Example

- 1. A query error occurs.
- 2. Bit 2 (QYE) is set to 1.
- 3. If bit 2 of the standard event enable register is 1, bit 5 (ESB) in the status byte is set to 1.

You can also check what type of event occurred in the WT1800 by reading the contents of the standard event register.

Reading the Standard Event Register

You can use the *ESR? command to read the contents of the standard event register. The register is cleared after it is read.

Clearing the Standard Event Register

The standard event register is cleared in the following three cases.

- The contents of the standard event register are read using the *ESR? command.
- A *CLS command is received.
- The instrument is turned off and then back on.

6-4 IM WT1801-17EN

6.4 Extended Event Register

The extended event register receives information about changes in the condition register, which indicates the instrument's internal condition. The information is the result of edge detection performed by the transition filter.

The condition register bits are described below.

Bit 0	UPD (Updating)	Set to 1 when the measured data is being updated. UPD changing from 1 to 0 indicates that updating has
		been completed.
Bit 1	ITG (Integrate Busy)	Set to 1 during integration.
Bit 2	ITM (Integrate Timer Busy)	Set to 1 when the integration timer is operating.
Bit 3	STR (Store Busy)	Set to 1 during storage.
Bit 4	FOV (Frequency Over)	Set to 1 when a frequency error occurs.
Bit 5	PRN (Printing)	Set to 1 when the built-in printer is operating.
Bit 6	ACS (Accessing)	Set to 1 when a drive is being accessed.
Bit 7	PLLE (PLL Source Input	Set to 1 when, during harmonic measurement, there is no
	Error)	PLL source or synchronization cannot be achieved.
Bit 8	OVR1 (Element1 Measured	Set to 1 when the voltage or current of element 1 exceeds
	Data Over)	its range.
Bit 9	OVR2 (Element2 Measured	Set to 1 when the voltage or current of element 2 exceeds
	Data Over)	its range.
Bit 10	OVR3 (Element3 Measured	Set to 1 when the voltage or current of element 3 exceeds
	Data Over)	its range.
Bit 11	OVR4 (Element4 Measured	Set to 1 when the voltage or current of element 4 exceeds
	Data Over)	its range.
Bit 12	OVR5 (Element5 Measured	Set to 1 when the voltage or current of element 5 exceeds
	Data Over)	its range.
Bit 13	OVR6 (Element6 Measured	Set to 1 when the voltage or current of element 6 exceeds
	Data Over)	its range.
Bit 14	OVRM (Motor Measured	Set to 1 when the speed or torque of the motor input or
	Data Over)	auxiliary input AUX1 or AUX2 exceeds its range.
Bit 15	POV (ElementX Input Peak	Set to 1 when a peak over-range is detected on any of the
	Over)	elements.

The transition filter parameters detect changes in the specified condition register bits (numeric suffixes 1 to 16) and overwrite the extended event register in the following ways.

RISE	The specified extended event register bit is set to 1 when the corresponding condition register bit changes from 0 to 1.
FALL	The specified extended event register bit is set to 1 when the corresponding condition register bit changes from 1 to 0.
ВОТН	The specified extended event register bit is set to 1 when the corresponding condition register bit changes from 0 to 1 or from 1 to 0.
NEVer	Always zero.

6.5 Output and Error Queues

Output Queue

The output queue stores query response messages. For example, if you send a :WAVeform: SEND? command, which requests for the transmission of acquired waveform data, the data is stored in the output queue until it is read.

As shown below, data is stored in order and read from the oldest message first. The output queue is cleared in the following cases.

- · A new message is received from the controller.
- · A deadlock occurs (see page 4-2).
- · A device clear command (DCL or SDC) is received.
- · The instrument is turned off and then back on.

The *CLS command does not clear the output queue. You can determine whether the output queue is empty by checking bit 4 (MAV) in the status byte.

Error Queue

When an error occurs, the error queue stores the error number and message. For example, if the instrument receives an incorrect program message from the controller, the error number (113) and the error message ("Undefined header") are stored in the error queue when the instrument displays the error message.

You can use the :STATus:ERRor? query to read the contents of the error queue. Like those in the output queue, the messages in the error queue are read from the oldest one first.

If the error queue overflows, the last message is replaced with the following message: 350, "Queue overflow"

The error queue is cleared in the following cases.

- A *CLS command is received.
- · The instrument is turned off and then back on.

You can determine whether the error queue is empty by checking bit 2 (EAV) in the status byte.

6-6

This section explains communication error messages.

- On the WT1800, the messages can be displayed in the language that you specify with the Menu Language setting on the System Config menu. However, any messages that you read from a PC or other controller will be displayed in English.
- If servicing is necessary to solve the problem indicated by a message, contact your nearest YOKOGAWA dealer.
- Only communication error messages are listed here. For details on other error messages, see the user's manual, IM WT1801-02EN.
